

Cassie is a 7year old Labrador who has had problems with her weight all her life. She has been on a prescription food for many years, her owners were being strict with her by reducing and changing her treats to carrots and other vegetables but nothing seemed to be helping her. One of the drug companies brought out a new personalised weight loss program and Cassie was the perfect candidate for it. The medication comes in a liquid form and Cassie was started on her initial dose with a target set of losing 3% of her body weight each month for 5 months (this would mean losing 5.1Kg) Cassie came to the surgery every month to be weighed and have her dose altered depending on how much weight she had been losing. Each month her weight was coming down steadily, her progress was brilliant. Cassie met her first target weight within the 5months, she was looking really good and her owners noticed a much-improved energy level. We then re-assessed her body condition and decided another kilo and she will be the right weight for her build. Cassie has lost a total 6.3Kg!!! She is now off the liquid treatment and has changed from her weight loss food to a maintenance diet. Its important that we still weigh Cassie regularly to make sure she is getting the correct meal sizes or her new food and sticking to her current weight.

WELL DONE CASSIE!!
